## Getting Started

### Power On, Off

#### ■ First time operation:

1. Remove the battery insulation tab to load the battery.
2. Press **ON** **Shift** **CLR** **3** **=** **CA** to initialize the calculator.

**Power ON:** When **ON** is pressed.

**Power OFF:** **Shift** **OFF** are pressed.

#### ■ Auto Power off Function:

When the calculator is not used for approximately 7 minutes, it will automatically power off.

### Display Contrast Adjustment

- Press **Shift** **SET-UP** **6** (6: **◀CONT▶**), to enter the Display Contrast Adjustment screen.

Press **▶** to darken the display contrast.

Press **◀** to lighten the display contrast.

Press **CA** or **ON** to confirm and clear the screen.

- To initialize the LCD contrast, press **Shift** **CLR** **3** **=** **CA** outside the **Display Contrast Adjustment** screen.

### Mode Selection

- Press **MODE** to enter the Calculation Mode Selection screen.

Operation	Mode		LCD Indicator
MODE <b>1</b>	COMP	Normal calculations	
MODE <b>2</b>	CPLX	Complex number calculation	CPLX
MODE <b>3</b>	STAT	Statistical and regression calculations	STAT
MODE <b>4</b>	BASE	Calculations involving specific number systems	
MODE <b>5</b>	EQN	Equation solution	EQN
MODE <b>6</b>	TABLE	Function table generation	
MODE <b>7</b>	MATX	Matrix calculations	MATX
MODE <b>8</b>	VCTR	Vector calculations	VCTR

- The default mode is COMP mode.

### Application Function Menu (Apps Key)

The Apps menu contains mathematical functions. In each Calculation Mode, the listed functions are different.

- Press **MODE** and corresponding number to enter the calculation mode.
- Press **Apps** to enter the Apps menu.
- Press **▼** / **▲** for next / previous pages.

#### i) COMP Mode

1: $\pi$	2: $\Sigma$
3: Max	4: Min
5: $\Omega, r$	6: Mod
7: LCM	8: GCD

#### ii) CPLX Mode

1: $r \angle \theta$	2: $a+bi$
3: Arg	4: Conjg
5: Real	6: Imag

#### iii) STAT Mode

In REG mode

#### iv) BASE Mode

1: and	2: or <b>▼</b>
3: xor	4: xnor
5: Not	6: Neg

Press [ **▼** ]  
or [ **▲** ] key

1: d	2: h <b>▲</b>
3: b	4: o

### v) EQN Mode

### vi) MATX Mode

### vii) VCTR Mode

■ Press   to exit the Apps menu.

## Calculator Set-up Menu

■ Press   to enter the **Calculator Set-up Menu**;  
press [▼] / [▲] for next / previous page.

■ **To select the calculator input & output format [1] Maths or [2] Line**

[1] Maths – (Mathematics mode):  
The majority of calculation input and output (e.g. Fraction, pi, square root number) are shown in Mathematics textbook format.

Mathematics mode

$\frac{\sqrt{5+1}}{3-1}$	$\frac{\sqrt{6}}{2}$
--------------------------	----------------------

[2] Line – (Line mode): The majority of calculation input and output are shown in the line format. The "LINE" icon will be shown.

Line mode

$\sqrt{(5+1)} \div (3-1)$ <sup>LINE</sup>
1.224744871

For the STAT, EQN, MATX, VCTR mode, the Input & Display format will switch to Line mode automatically.

■ **To select the angle unit [3] Deg, [4] Rad or [5] Gra**

[3] Deg: Angle unit in Degree

[4] Rad: Angle unit in Radian

[5] Gra: Angle unit in Gradient

$$90^\circ = \frac{\pi}{2} \text{ radians} = 100 \text{ grads}$$

■ **To select display digit or notation [6] Fix, [7] Sci or [8] Norm**

[6] Fix: Fixed Decimal, [Fix 0~9?] appears, specify the number of decimal places by pressing [0] – [9].

$$\begin{aligned} \text{Example: } 220 \div 7 &= 31.4286 \text{ (FIX 4)} \\ &= 31.43 \text{ (FIX 2)} \end{aligned}$$

[7] Sci: Scientific Notation, [Sci 0~9?] appears, specify the number of significant digits by pressing [0] – [9].

$$\begin{aligned} \text{Example: } 220 \div 7 &= 3.1429 \times 10^1 \text{ (SCI 5)} \\ &= 3.143 \times 10^1 \text{ (SCI 4)} \end{aligned}$$

[8] Norm: Exponential Notation, [Norm 1~2?] appears, specify the exponential notation format by pressing [1] or [2].

Norm 1: Exponential notation is automatically used for integer values with more than 10 digits and decimal values with more than **TWO** decimal points.

Norm 2: Exponential notation is automatically used for integer values with more than 10 digits and decimal values with more than **NINE** decimal places.

$$\begin{aligned} \text{Example: } 1 \div 1000 &= 1 \times 10^{-3} \text{ (Norm 1)} \\ &= 0.001 \text{ (Norm 2)} \end{aligned}$$

■ **To select the fraction format [1] a b/c or [2] d/c**

[1] a b/c: specify Mixed fraction display

[2] d/c: specify Improper fraction display

■ **To select the complex number display format [3] CLPX ([1] a+bi or [2] r<θ)**

[1] a+bi: specify Rectangular Coordinates

[2] r<θ : specify Polar Coordinates

■ **To select the statistical display format [4] STAT ([1] ON or [2] OFF)**

[1] ON: Show FREQ (Frequency) Column in Statistical Data Input Screen

[2] OFF: Hide FREQ (Frequency) Column in Statistical Data Input Screen

■ **To select the decimal point display format [5] Disp ([1] Dot or [2] Comma)**

[1] Dot: specify dot format for Decimal point result display

[2] Comma: specify comma format for Decimal point result display

■ **To Adjust Display contrast [6] ◀ CONT ▶**

Refer to the "Display Contrast Adjustment" section.

### Before Using the Calculator

■ **Check the current Calculation Mode**

Be sure to check the status indicators that indicate the current calculation mode (COMP, STAT, TABLE), display formats setting, and angle unit setting (Deg, Rad, Gra).

■ **Return to initial setup**

Press  $\text{Shift CLR}$   $\boxed{1}$   $\boxed{=}$  (YES)  $\boxed{CA}$  to return the initial calculator setup:

Calculation mode	: COMP
Input/Output Format	: Maths
Angle unit	: Deg
Display Digits	: Norm 1
Fraction Display Format	: d/c
Statistical Data Input	: OFF
Decimal Point format	: Dot

This action will not clear the variable memories.

■ **Initialize the calculator**

When you are not sure of the current calculator setting, you are recommended to initialize the calculator (resets calculation mode to "COMP", angle unit to "Degree", clears replay and variable memories, and resets LCD contrast) by performing the following key operations:

$\text{Shift CLR}$   $\boxed{3}$  (All)  $\boxed{=}$  (YES)  $\boxed{CA}$ .

# Inputting Expressions and Values

## Input Capacity

F-789SGA allows you to input a single calculation with up to 99 bytes. Normally, one byte is used each time you press one of the numeric keys, arithmetic keys, scientific function keys or **Ans**. Some functions require 4 – 13bytes.  $\overset{\text{Shift}}{\square}$ ,  $\overset{\text{Alpha}}{\square}$ , and the direction keys will not use up any bytes.

When the remaining input capacity is less than 10bytes, the input cursor will change from " | " to " ■ " signaling that the memory is running now.

## Input Editing

- New Input begins on the left of display. When the input data is more than 15 characters (Line Mode) / 16 characters (Math mode), the line will scroll to the right consecutively. You can scroll back to the left by using  $\leftarrow$  and  $\rightarrow$  to review the input.
- In Line mode, press  $\uparrow$  to let the cursor jump to the beginning of input, press  $\downarrow$  to jump to the end.
- In Mathematics mode, press  $\rightarrow$  to let the cursor jump to the beginning of input when it is at the end of the input calculation. Or press  $\leftarrow$  to let the cursor jump to the end of input when it is at the beginning of the input calculation.
- Omit the multiplication sign and final close parenthesis.

**Example:**  $2 \times \log 100 \times (1+3) = 16$

	Operation 1:	Display 1
Including $\times$ *1, ) *2, ) *3	$2 \times \log 100 ) \times$ $( 1 + 3 ) =$ 	$2 \times \log(100) \times (1+3)$  16
	Operation 2:	Display 2
Omitting $\times$ *1, ) *3	$2 \log 100 ) ( 1$ $+ 3 =$	$2 \log(100)(1+3)$  16

\*1. Omit multiplication sign (x)

- Input before an open parentheses  $($ :  $1 \times (2+3)$
- Input before scientific functions that includes parentheses:  $2 \times \cos(30)$
- Input before Random number function  $\overset{\text{Rand}}{\square}$
- Input before Variable (A, B, C, D, X, Y, M),  $\pi$ ,  $\theta$

- \*2. Scientific functions come with the open parenthesis.  
Example: sin(, cos(, Pol(, LCM(... You need to input the argument and the close parenthesis  $\text{)}\text{}$ .
- \*3. Omit the last close parenthesis before the  $\text{=}$ ,  $\text{M+}$ ,  $\text{M}^-$ ,  $\text{Shift STO}$  and  $\text{STO}$ .

### ■ Insert and Overwrite Input mode

In Line mode, you can use INSERT  $\text{Insert}$  or overwrite mode for inputting.

- In Insert mode (Default input mode), the cursor is a vertical flashing line " | " for inserting a new character.
- In Overwrite mode, press  $\text{Shift Insert}$  key to switch the cursor to a flashing horizontal " \_ " and replace the character at the current cursor position.

In Mathematics mode, you can only use the Insert mode.

Whenever the display format changes from Line mode to Mathematics mode, it will automatically switch to the Insert mode.

### ■ Deleting and Correcting an Expression

In Insert mode: Move the cursor to the right of the character or function that needs to be deleted, then press  $\text{DEL}$ .

In Overwrite mode: Move the cursor under the character or function being deleted, then press  $\text{DEL}$ .

**Example:** 1234567 + 889900

#### (1) Replace an entry (1234567 → 1234560)

Mode Setting	Key In operation	Display (input Line only)
<b>Method 1:</b> Line/Maths mode - Insert mode	1234567 $\text{+}$ 889900 $\text{◀}$ 7 times	1234567 +889900
	$\text{DEL}$ $\text{0}$	1234560 +889900
<b>Method 2:</b> Line mode - Overwrite mode	$\text{Shift SET-UP}$ $\text{2}$ 1234567 $\text{+}$ 889900 $\text{Shift Insert}$	1234567+889900_
	$\text{◀}$ 8 times	1234567+889900
	$\text{0}$	1234560+889900

#### (2) Deletion (1234567 → 134567)

<b>Method 1:</b> Line/Maths mode - Insert mode	$\text{◀}$ 12times	12 34567+889900
	$\text{DEL}$	1 34567+889900
<b>Method 2:</b> Line mode - Overwrite mode	$\text{Shift Insert}$	1234567+889900_
	$\text{◀}$ 13times	1234567+889900
	$\text{DEL}$	134567+889900

### (3) Insertion (889900 → 2889900)

Line/Maths mode -	⏪ 6times	1234567+ 889900
Insert mode	2	1234567+2 889900

### Inputting and Display Result in Mathematics Mode

- In Mathematic Mode, the input and display result of fraction or certain functions ( $\log$ ,  $x^2$ ,  $x^3$ ,  $x^{\square}$ ,  $\sqrt{\square}$ ,  $\sqrt[3]{\square}$ ,  $\sqrt[n]{\square}$ ,  $x^{-1}$ ,  $10^{\square}$ ,  $e^{\square}$ , Abs) is shown in Handwriting/Mathematics format.

**MATHEMATICS MODE:**  Shift  SET-UP  1

Example	Key in operation	Display
$\left  \sqrt{3} - \frac{2}{\sqrt{2}} \right $	Abs $\sqrt{\square}$ 3 $\rightarrow$ - 2 $\frac{\square}{\square}$ $\sqrt{\square}$ 2 =	$\left  \sqrt{3} - \frac{2}{\sqrt{2}} \right $ $\sqrt{3} - \sqrt{2}$

### NOTE

- (1) Some input expressions cause the height of a calculation expression to be greater than one display screen. Maximum input capacity: 2 display screens (31 dots x 2).
- (2) Calculator memory limits how many functions or parentheses can be input in any single expression. In this case, divide the expression into multiple parts and calculate separately.
- (3) If part of the expression you input is cut off after calculation and in the result display screen, you can press  $\leftarrow$  or  $\rightarrow$  to view the full expression.

### ■ Display of results using $\sqrt{\quad}$

Calculation results may be displayed using  $\sqrt{\quad}$  in all of the following cases:

1. When intermediate and final calculation results are displayed in the following form:

$$\pm \frac{a\sqrt{b}}{c} \pm \frac{d\sqrt{e}}{f}$$

$$0 \leq a < 100, \quad 1 \leq d < 100$$

$$0 \leq b < 1000, \quad 1 \leq e < 1000$$

$$1 \leq c < 100, \quad 1 \leq f < 100$$

2. When the number of terms in the intermediate and final calculation result involving  $\sqrt{\quad}$  is one or two.

## Order of Operations

This calculator will automatically determine the operation priority of each individual command as follows:-

1st Priority	Recall memory (A, B, C, D, E, F, 0-9), Rand
2nd	Calculation within parentheses ( ).
3rd	Function with parenthesis that request the input argument to the right Pol(, Rec(, d/dx, $\int$ dx, P(, Q(, R(, Det(, Trn(, Ide(, Adj(, Inv(, Arg(, Conjg(, Real(, Imag(, sin(, cos(, tan(, $\sin^{-1}$ (, $\cos^{-1}$ (, $\tan^{-1}$ (, sinh(, cosh(, tanh(, $\sinh^{-1}$ (, $\cosh^{-1}$ (, $\tanh^{-1}$ (, log(, ln(, e^(, 10^(, $\sqrt{\quad}$ (, $\sqrt[3]{\quad}$ (, Abs(, ROUND(, LCM(, GCD(, Q...r(, i-Rand(,

- In the same precedence level, calculations are performed from left to right.
- Operations enclosed within parentheses are performed first. When a calculation contains an argument that is a negative number, the negative number must be enclosed within the parentheses.

### Example:

$$\boxed{(-)} \boxed{2} \boxed{x^2} \boxed{=} \quad -2^2 = -4$$

$$\boxed{(} \boxed{(-)} \boxed{2} \boxed{)} \boxed{x^2} \boxed{=} \quad (-2)^2 = 4$$

- When same priority commands are mixed into one calculation:

### Example 1:

$$\boxed{1} \boxed{\div} \boxed{2} \boxed{\text{Shift}} \boxed{\pi} \boxed{=} \quad 1 \div 2\pi = 0.1591549431$$

### Example 2:

$$\boxed{2} \boxed{\text{Shift}} \boxed{\text{sto}} \boxed{(-)} \quad 2 \rightarrow A$$

$$\boxed{1} \boxed{\div} \boxed{2} \boxed{\text{Alpha}} \boxed{A} \boxed{=} \quad 1 \div 2A = \frac{1}{4}$$

## Calculation Stacks

- This calculator uses memory areas, called “stacks”, to temporarily store numeric value (numbers) commands (+, -, x...) and functions according to their precedence during calculations.
- The numeric stack has 10 levels and the command stack has 128 levels. A stack error [Stack ERROR] occurs whenever you try to perform a calculation that exceeds the capacity of stacks.
- Calculations are performed in sequence according to “Order of Operations”. After the calculation is performed, the stored stack values will be released.

## Error Messages and Error Locator

The calculator is locked up when an error message is shown on the display indicating the cause of the error.

- Press **CA** to clear the error message, then return to the initial display of the latest mode.
- Press **←** or **→** to display the input expression with the cursor positioned next to the error.
- Press **ON** to clear the error message, replay memory history and return to the initial display of the latest mode.

## Basic Calculations

- Press **MODE** **1** to enter COMP mode.
- As the calculation is busy processing, the calculator shows the message [PROCESSING] (without any calculation result). Press **CA** key to interrupt the calculating operation.

## Arithmetic Calculations

**+** **-** **×** **÷**

- To calculate the negative values (exclude the negative exponent) enclose then within the parentheses.
- This calculator supports 99 levels of parenthetical expression.

**MATHEMATICS MODE:** **Shift** **SET-UP** **1**

## Memory Calculations

**Ans** **M<sup>-</sup>** **M<sup>+</sup>** **M** **STO** **RCL**

### Memory Variables

- There are 19 memory variables (0 – 9, A – F, M, X and Y), which store data, results, or dedicated values.
- Store values into memory by pressing **Shift** **STO** + Memory variable.
- Recall memory values by pressing **RCL** + Memory variable.
- Memory content can be cleared by pressing **0** **Shift** **STO** + Memory variable.

**Example:**  $23 + 7 \rightarrow A$  (30 store into A), calculate  $2 \sin A$  and clear memory A.

**MATHEMATICS MODE:**  $\square$   $\overset{\text{Shift}}{\square}$   $\overset{\text{SET-UP}}{\square}$  **1**

Example	Key in operation	Display
$23 + 7 \rightarrow A$	$\square$ $\square$ $\square$ $\square$ $\overset{\text{Shift}}{\square}$ $\overset{\text{STO}}{\square}$ $\overset{\text{A}}{\square}$	$23+7 \rightarrow A$  30
$2 \times \sin A = 1$	$\square$ $\square$ $\overset{\text{Alpha}}{\square}$ $\overset{\text{A}}{\square}$ $\square$	$2\sin(A)$  1
Clear memory	$\square$ $\overset{\text{Shift}}{\square}$ $\overset{\text{STO}}{\square}$ $\overset{\text{A}}{\square}$	$0 \rightarrow A$  0

### Independent Memory

- Independent memory  $\overset{\text{M}}{\square}$  uses the same memory area as variable M. It is convenient for calculating cumulative totals by pressing  $\square$  (add to memory) or  $\overset{\text{M-}}{\square}$  (subtract from memory).
- Memory contents are retained even when the calculator is powered off.
- Clear independent memory (M) by pressing  $\square$   $\overset{\text{Shift}}{\square}$   $\overset{\text{M}}{\square}$ .
- Clear all memory values by pressing  $\overset{\text{Shift}}{\square}$   $\overset{\text{CLR}}{\square}$  2(MCL)  $\square$   $\square$ .

### Answer Memory

- The input values or the most recent calculation result will be automatically stored into Answer memory whenever you press  $\square$ ,  $\overset{\text{Shift}}{\square}$   $\square$ ,  $\square$   $\overset{\text{Shift}}{\square}$   $\overset{\text{M-}}{\square}$ ,  $\overset{\text{Shift}}{\square}$   $\overset{\text{STO}}{\square}$ . Answer memory can hold up to 18 digits.
- Recall and use the latest stored Answer memory by pressing  $\square$ .
- Answer memory is not updated when an error operation has been performed.
- Answer memory contents can be maintained even after pressing  $\square$ , changing the calculation mode, or turning off the calculator.

Example	Key in operation	Display
$123 + 456 \rightarrow M+$ , $\text{Ans}^2 = 335,241$	$\square$ $\square$ $\square$ $\square$ $\square$ $\square$ $\square$ $\square$ $\square$ $\square$ $\square$ $\square$ $\square$ $\square$ $\square$	$\text{Ans}^2$  335241

## Fraction Calculations

The calculator supports Fraction calculation and the conversions between Fraction, Decimal point, Mixed fraction and Improper fraction.

- Specify the fraction calculation result display format by selecting either **mixed fraction** ( $\frac{a}{b}/\frac{c}{d}$ ) or **improper fraction** ( $\frac{d}{c}$ ) in set-up menu.
- At the default setting, fractions are displayed as improper fractions ( $\frac{d}{c}$ ).
- Mixed Fraction display results are only available after selecting ( $\frac{a}{b}/\frac{c}{d}$ ) in the setup menu.

	Improper Fraction (d/c)	Mixed Fraction (a b/c)
Maths Mode	$\frac{11}{3}$	$3\frac{2}{3}$
Line Mode	11_3	3_2_3

- Press **F→D** to switch a calculation result between fraction and decimal format.
- Press **Shift**  $\frac{a}{b}/\frac{c}{d}$  to switch a calculation result between improper fraction and mixed fraction format.
- Results will be displayed in decimal format automatically whenever the total digits of a fractional value (integer + numerator + denominator + separator marks) exceeds 10.
- When a fraction calculation is mixed with decimal values, the result will be displayed in decimal format.

## Fraction ↔ Decimal point conversion

## Display Values Exchange

- In Maths mode, press **F↔D** to change the calculation result value between fraction form ↔ Decimal form,  $\pi$  form ↔ Decimal form,  $\sqrt{\quad}$  form ↔ Decimal form.
- In Line mode, press **F↔D** to **ONLY** change the calculation result value between fraction form ↔ Decimal form, the other  $\pi$  and  $\sqrt{\quad}$  calculation will display the decimal value only.

## Replay & Multi-statements

### ■ Replay Memory Function

- Replay memory is only available in COMP mode.
- After the calculation is executed, the calculation input and result will be stored in the replay memory automatically.
- Pressing  $\nabla$  (or  $\blacktriangle$ ) can replay the performed calculation input and result history.
- After obtaining the calculation result on the display, press  $\blacktriangleleft$  or  $\blacktriangleright$  to edit the input expression of that result.
- If the  $\blacktriangleright$  Indicator is on the right side of a calculation result display, you need to press  $\boxed{\text{CA}}$  and then  $\blacktriangleleft$  or  $\blacktriangleright$  to scroll through the calculation.
- Replay memory is cleared when you:
  1. Initialize calculator setting by  $\boxed{\text{Shift}} \boxed{\text{CLR}} \boxed{3} \boxed{=}$   $\boxed{\text{CA}}$
  2. Change from one calculation mode or display mode to another.
  3. Press  $\boxed{\text{ON}}$  key.
  4. Press  $\boxed{\text{Shift}} \boxed{\text{OFF}}$  to power off the machine.

### ■ Multi-statements Function

- Use a colon  $\boxed{;}$  to put two or more calculation expressions together.
- The first executed statement will have "Disp" indicator; and the "Disp" icon will disappear after the last statement is executed.

## MATHEMATICS MODE: $\boxed{\text{Shift}} \boxed{\text{SET-UP}} \boxed{1}$

## Metric Conversions

CONVT

The calculator has 172 conversion pairs which allows you to convert a number to and from the specified metric units.

- Press **CONVT** enter the conversion menu.
- There are 8 category pages (distance, area, temperature, capacity, weight, energy, pressure and speed) containing 36 metric symbols, you can press **▲** or **▼** to change the category selection page.
- In a category page, you can shift the selection cursor left or right by pressing **◀** or **▶**.

Page	Symbol	Unit
1	feet	feet
1	m	meter
1	mil	milliliter
1	mm	millimeter
1	in	inch
1	cm	centimeter
1	yd	yard

2	ft <sup>2</sup>	square foot
2	yd <sup>2</sup>	square yard
2	m <sup>2</sup>	square meter
2	mile <sup>2</sup>	square mile
2	km <sup>2</sup>	square kilometer
2	hectares	hectare
2	acres	acre
3	°F	degree Fahrenheit
3	°C	degree Celsius
4	gal	gallon (U.K.)
4	liter	liter
4	B.gal	gallon (U.S.)
4	pint	pint
4	fl.oz	fluid ounces (U.S.)
5	Tr.oz	ounce (troy or apothecary)
5	oz	ounces
5	lb	libra
5	Kg	kilogram
5	g	gram
6	J	joule
6	cal.f	calorie
7	atm	standard atmosphere
7	Kpa	kilopascal
7	mmHg	millimeter of mercury
7	cmH <sub>2</sub> O	centimeter of water
8	m/s	Meter per second
8	km/h	Kilometer per hour

- Go back to the calculation mode by pressing  $\boxed{\text{CONVT}}$  within the category selection menu. After the base conversion unit,  $\boxed{\uparrow}$ ,  $\boxed{\downarrow}$  or  $\boxed{\text{CONVT}}$  keys will be invalid.
- If the converted result overflows, [ERROR] will be shown in the lower display. Press  $\boxed{=}$  to select the overflow value; the following scenarios are valid:
  - Scenario A - Keep selecting the other conversion value by pressing  $\boxed{\leftarrow}$  or  $\boxed{\rightarrow}$ .
  - Scenario B - Clear the screen and jump out of the selection by pressing  $\boxed{\text{ON}}$  or  $\boxed{\text{CA}}$ .
  - Scenario C - Jump back to the previous calculation screen by pressing  $\boxed{\text{CONVT}}$ .

## Angle Unit Conversion

The default calculator angle unit setting is "Degree". Press  $\square$  Shift  $\square$  SET-UP to enter the setup menu to change the unit to "Radian" or "Gradient";

1: Maths	2: Line
3: Deg	4: Rad
5: Gra	6: Fix
7: Sci	8: Norm

Press the corresponding number key  $\square$  3,  $\square$  4 or  $\square$  5 for the angle unit you need. Then the display will show the **D**, **R**, **G** Indicator accordingly.

Convert an angle unit between "Degree", "Radian" and "Gradient" by pressing  $\square$  Shift  $\square$  DRG $\rightarrow$

1: °	2: °
3: °	

Then, pressing  $\square$  1,  $\square$  2, or  $\square$  3 will convert the displayed value into the selected angle unit.

## Prime Factorization

PFact

- Factor a positive integer of up to 10 digits into prime factors of up to 3 digits.

Pfact Number :  $0 < X < 99999\ 99999$  (X is integer)

- The remainder that cannot be factored will be enclosed in parentheses on the display.

**Example:**  $99999\ 99999 = 3^2 \times 11 \times 41 \times 271 \times (9091)$

**MATHEMATICS MODE:**  Shift  SET-UP  1

### NOTE:

- During any calculation operations, pressing  Shift  PFact or  = or  ENG or  ° ' " key will exit the prime factorization result display.
- Use the setup menu to change the angle unit setting (Deg, Rad, Gra) or display digit setting (Fix, Sci, Norm).
- [Math ERROR] will be shown if decimal value, fraction, negative value calculation result, or Pol, Rec, Q...R is displayed.

## Quotient and Remainder Calculations

- "Quotient" (Q) is the result in a division problem, "Remainder" (r) is the value remaining in an integer division problem.
- The calculated quotient value (Q) and remainder (r) will be stored into memory variables "C" and "D", automatically assigned.
- In Maths mode, press  $\leftarrow$  or  $\rightarrow$  to scroll through a long calculation result.
- In Line mode, the quotient value (Q) and remainder (r) will be shown over 2 lines.
- Only the Quotient Value (Q) can continue to be used for the next calculation or be stored into memory variables.

**LINE MODE:**  $\text{Shift}$   $\text{SET-UP}$   $\text{2}$

Example	Key in operation	Display

## Coordinate Conversion

- With polar coordinates, you can calculate and Display  $\theta$  within the range of  $-180^\circ < \theta \leq 180^\circ$ . (Same as Radian and Gradient)
- In Maths mode, press  $\leftarrow$  or  $\rightarrow$  to scroll the through calculation result.
- In Line mode, (x,y) or (r,  $\theta$ ) will be shown over 2 lines.
- After conversion, the results will automatically be assigned to memory variables X and Y. Press  $\text{RCL}$   $\text{X}$  or  $\text{Y}$  to show the results.

**Shift** **Pol** : Convert rectangular coordinates (x, y) to polar coordinates (r,  $\theta$ ); Press **RCL**  $\overset{x}{\square}$  for r, or **RCL**  $\overset{y}{\square}$  for  $\theta$ .

**MATHEMATICS MODE:** **Shift** **SET-UP** **1**

## Complex Number Calculations

Abs  $\angle$   $i$

Complex numbers can be expressed in rectangular form ( $z = a + bi$ ) or polar form ( $r \angle \theta$ ). Where "a" is the real number, "b" is the imaginary number (and  $i$  is the imaginary unit equal to the square root of  $-1$ ,  $\sqrt{-1}$ ), "r" is the absolute value, and " $\theta$ " is the argument of the complex number.

- Press **MODE** **2** to enter CPLX mode.
- Press **Apps** to select the calculation type.

### Complex Number Type Selection

There are 6 types of complex number calculations in the Complex Number Type screen. Press the number to select the type of Complex Number Calculation:

```

1: ▶r∠θ   2: ▶a+bi
3: Arg    4: Conjg
5: Real   6: Imag
    
```

- Check the current angle unit setting (Deg, Rad, Grad).
- [ $i$ ] indicates the display result is the imaginary number; [ $\angle$ ] indicates the display value is the argument value  $\theta$ .
- Imaginary numbers will use up replay memory capacity.

### Rectangular Form and Polar Form Conversion

## Base-n Calculations and Logical Calculations

- Press **MODE** **4** to enter Base-n mode.
- Decimal (base 10), hexadecimal (base 16), binary (base 2), octal (base 8), or logical calculations.
- To select a specific number system in base mode, simply press **DEC** Decimal [DEC], **HEX** Hexadecimal [HEX], **BIN** Binary [BIN] or **OCT** Octal [OCT].
- Press **Apps** key to perform logical calculations including: Logic connection [and] / [or], exclusive or [Xor], exclusive nor [Xnor], argument complement [Not] and negation [Neg].
- If the binary or octal calculation result is more than 8 digits, **◀BIK** will be displayed to indicate the result has a next block. Press **◀BIK** to loop between result blocks.
- In Base-n mode all the scientific functions cannot be used, and you cannot input the value with decimal places or exponents.

1 (SD)	One-variable statistics (x)
2 (Lin)	Two-variable, Linear regression ( $y = A+Bx$ )
3 (Quad)	Two-variable, Quadratic regression ( $y = A + Bx + Cx^2$ )
4 (Log)	Two-variable, Logarithmic regression ( $y = AxBlnx$ )
5 (e EXP)	Two-variable, E exponential regression ( $y = Ae^{Bx}$ )
6 (ab EXP)	Two-variable, ab Exponential regression ( $y = AB^x$ )
7 (Pwr)	Two-variable, Power regression ( $y = Ax^B$ )
8 (Inv)	Two-variable, Inverse regression ( $y = A+B/x$ )

## Statistical Data Input

After confirming the calculation type in the **Statistical Type Selection** screen or by pressing  $\text{Apps}$   $\boxed{2}$  (Data) in the STAT mode, the following Statistical Data Input screen will be shown:

1-variable STAT

2-variable STAT

- After turning on Data Frequency in the setup menu, the "FREQ" column will be added into the above screen.
- The following are the maximum number of lines for data input.

Statistic type	FREQ ON	FREQ OFF
Single Variable (only x input)	40	80
2 Variable (x & y input)	26	40

- Input expression and display result values in the **Statistical Data Input** screen are in Line mode (same as Comp mode with Line mode status).
- After inputting the data, press  $\boxed{=}$  to store the value into statistical registers and display the value (max. 6 digits) in the cell. You can press the cursor key to move the cursor between each cell.

## Editing Statistical Sample Data

### ■ Replacing the Data in a Cell

- (1) In the Statistical Data Input screen, move the cursor to the cell you want to edit.
- (2) Input the new data value or expression, and press  $\boxed{=}$ .

### ■ Deleting a Line

- (1) In the Statistical Data Input screen, move the cursor to the line you want to delete.
- (2) Press  $\boxed{\text{DEL}}$

### ■ Inserting a Line

- (1) In the Statistical Data Input screen, move the cursor to the line that will be under the line being inserted.
- (2) Press  $\text{Apps}$   $\boxed{3}$  (Edit)
- (3) Press  $\boxed{1}$  (Ins)

### ■ Deleting All STAT Data Input

- (1) Press  $\text{Apps}$   $\boxed{3}$  (Edit)
- (2) Press  $\boxed{2}$  (Del-A)

### Simultaneous Linear Equations

Simultaneous Linear Equations with Two Unknowns:

$$a_1x + b_1y = c_1$$

$$a_2x + b_2y = c_2$$

Simultaneous Linear Equations with Three Unknowns:

$$a_1x + b_1y + c_1z = d_1$$

$$a_2x + b_2y + c_2z = d_2$$

$$a_3x + b_3y + c_3z = d_3$$

Simultaneous Linear Equations with Four Unknowns:

$$a_1w + b_1x + c_1y + d_1z = e_1$$

$$a_2w + b_2x + c_2y + d_2z = e_2$$

$$a_3w + b_3x + c_3y + d_3z = e_3$$

$$a_4w + b_4x + c_4y + d_4z = e_4$$

**Example:** Solve the simultaneous equation with three unknowns:

$$2x + 4y - 4z = 20$$

$$2x - 2y + 4z = 8$$

$$5x - 2y - 2z = 20$$

## Quadratic, Cubic and Quart Equations

Quadratic equation :  $ax^2 + bx + c = 0$  (a second-order polynomial equation with a single variable  $x$ )

Cubic equation :  $ax^3 + bx^2 + cx + d = 0$  (an equation with cubic polynomial)

Quart equation :  $ax^4 + bx^3 + cx^2 + dx + e = 0$

**Example:** Solve the Cubic equation  $5x^3 + 2x^2 - 2x + 1 = 0$

- For Quadratic, Cubic or Quart equations, the variable name starts with "X1".

## Solve Function

- Solve functions use Newton's Method to obtain the approximate solution of equations.

**Note:** SOLVE function can be used in the COMP Mode only.

- The following describes the types of equations whose solutions can be obtained by using SOLVE function.
- Equations that include variable X,**  
SOLVE function solves for X, for example,  $X^2 + 2X - 2$ ,  $X = Y + 3$ ,  $X - 5 = A + B$ ,  $X = \tan(C)$ ,
  - Variable X to be solved should be put at the left hand side of the equation.  
For example, an equation is input as  $X^2 + 5X = 24$  or  $X^2 + 5X - 24 = 0$  or  $X^2 + 5X - 24$
  - An expression like  $X^2 + 5X - 24$  will be treated as  $X^2 + 5X - 24 = 0$ , not necessary to input "= 0".
- Equations input uses the following syntax :**  
**{equation},{solution variable}**  
In general, an equation is solved for X, unless specified. For example, to solve for Y when an equation is input as,  $Y = X + 5$ , Y

### Important precaution when using “Solve” function:

- The following functions  $\int$ ,  $\frac{d}{dx}$ ,  $\sum$ ,  $\pi$ , Pol, Rec, Q...r, Rand, i-Rand or multi-statement are not allowed to input into an equation for SOLVE function.
- Since SOLVE function uses Newton’s Method to obtain the solution, even if there are multiple solutions, only one of them will be shown as the solution.
- SOLVE function may not be able to obtain a solution because of preset initial value of the solution variable. In case this happens, try to change the initial value of the solution variable.
- SOLVE function may not be able to find the correct solution, even if the solution(s) exists.
- If an equation contains input functions that include an open parenthesis, do not omit the closing parenthesis.
- It will show “Variable ERROR” when the expression does not contain the variable that you want to solve.
- Newton’s Method may have problems for solving the following types of functions, for example  $y = e^x$ ,  $y = \frac{1}{x}$ ,  $y = \sin(x)$ ,  $y = \sqrt{x}$ , etc.
- In case the equation takes long time for solving, the calculator will display “PROCESSING” screen, you can cancel the processing of SOLVE operation by pressing the **CA** key.

**Example:** To solve  $X = \frac{1}{3} \pi B^2 C$  (when  $B=5$ ;  $C=20$ )

Key in Operation	Display
Alpha $\times$ Alpha = <b>1</b> $\frac{\square}{\square}$ <b>3</b> $\rightarrow$ Shift $\pi$ Alpha B $x^2$ Alpha C	$X = \frac{1}{3} \pi B^2 C$
Shift Solve	B? 0
<b>5</b> <b>=</b>	C? 0
<b>2</b> <b>0</b> <b>=</b>	Solve for X Initial value $\rightarrow$ 0
<b>=</b> Solution variable $\rightarrow$ Precision of solution $\rightarrow$	$X = \frac{1}{3} \pi B^2 C$ X = Solution $\rightarrow$ 523.5987756 L-R = 0

- The Precision of Solution shows the result when the obtained solution is assigned to the solution variable. The precision of the obtained solution is higher if this value is closer to zero.

### Continue Screen

- SOLVE performs convergence a preset number of times. If it cannot find a solution, it displays a confirmation screen that shows “Continue: [=]”, asking if you want to continue. Press **=** to continue or **CA** to cancel the SOLVE operation.

## CALC Function

- CALC function is a memory zone with a maximum of 79 steps to store a single calculation expression which can be recalled and calculated a number of times with different values.
- After inputting the calculation expression and pressing  $\boxed{\text{CALC}}$ , the calculator will request for the current value of your input variables.
- CALC function can only be used in **COMP mode** or **CPLX mode**.

**Example:** For the equation  $Y = 5x^2 - 2x + 1$ , calculate the value of Y if  $x = 5$  or  $x = 7$ .

## Differential Calculations

- Differential Calculations can be used in the COMP mode only.
- To perform a differential calculation, you have to input the expression in the form of:

$$\boxed{\text{Shift}} \boxed{\frac{d}{dx}} \boxed{\text{Alpha}} \boxed{f(x)} \boxed{'} \boxed{\text{Alpha}} \boxed{a} \boxed{'} \boxed{\Delta x} \boxed{)}$$

- $f(x)$  : Function of X. (All non-X variables are treated as constants.)
- $a$  : Differential point.
- $\Delta x$  : Tolerance (calculation precision); for Line mode only

- Your calculator performs differential calculations by approximating the derivative based on centered difference approximation.

**Example:** To determine the derivative at point  $x = 10$ ,  $\Delta x = 10^{-8}$ , for the function  $f(x) = \sin(3x + 30)$

- ! You can leave out the  $\Delta x$  in the differential expression and the calculator will automatically substitute a value for  $\Delta x$ .
- ! The smaller the entered value  $\Delta x$  is, the longer the calculation time will be with more accurate results, the larger the entered value  $\Delta x$  is, the shorter the calculation time will be with comparatively less accurate results.
- ! Inaccurate results and errors can be caused by the following :
  - Discontinuous points in x values
  - Extreme changes in x value
  - Inclusion of the local maximum point and local minimum point in x values.
  - Inclusion of the inflection point in x values
  - Inclusion of undifferentiable points in x values
  - Differential calculation results approaching zero
- ! When performing differential calculations with trigonometric functions, select radian (Rad) as the angle unit setting.
- !  $\text{Log}_a$ ,  $i\sim\text{Rand}$ (,  $\text{Rec}$ (,  $\text{Pol}$ (,  $\int$ (,  $d/dx$ (,  $\Sigma$ (,  $\Pi$ (,  $\text{Max}$ ( and  $\text{Min}$ ( functions cannot join in differential calculations.
- ! You can cancel the processing of differential calculation by pressing the  $\boxed{\text{CA}}$  key.

## Integration Calculations

- Integration Calculations can be used in the COMP mode only.
- To perform an integration calculation you are required to input the following elements:

$$\int_a^b f(x) dx \quad \boxed{n}$$

- $f(x)$  : Function of X. (All non-X variables are treated as constants.)
- $a, b$  : The integration range of the definite integral.
- $n$  : Tolerance; for Line Mode only
- The integration calculation is based on Gauss-kronrod method.
- The internal integration calculations may take considerable time to complete. For some cases, even after considerable time is spent performing a calculation, the calculation results may be erroneous. Particularly when significant digits are less than 1, an ERROR might occur.

**Example:** Perform the integration calculation for, with  $n = 4$ .

$$\int_2^3 (5x^4 + 3x^2 + 2x + 1)dx$$

## Battery Replacement

Replace the battery immediately when the display characters are dim even with a darker LCD display contrast **OR** when the following message appears on the screen. Turn the calculator off and replace the lithium battery immediately.

Low Battery

Please replace the lithium battery with the following procedures,

1. Press  $\square$  <sup>shift</sup>  $\square$  <sup>OFF</sup> to power off the calculator.
2. Remove the screw that securely fixes the battery cover in place.
3. Remove battery cover.
4. Remove the old battery with the tip of a ball pen or similar sharp object.
5. Load the new battery with positive "+" side facing up.
6. Replace the battery cover, screw, and press  $\square$  <sup>ON</sup>,  $\square$  <sup>shift</sup>  $\square$  <sup>CLR</sup>  $\square$  **3**  $\square$   $\square$  **CA** to initialize the calculator.

**Caution:** Risk of explosion if battery is replaced with an incorrect type. Dispose of used battery according to the instructions.

- Electromagnetic interference or electrostatic discharge may cause the display to malfunction or the contents of the memory to be lost or altered. Should this occur, press  $\square$  <sup>ON</sup>,  $\square$  <sup>shift</sup>  $\square$  <sup>CLR</sup>  $\square$  **3**  $\square$   $\square$  **CA** to restart the calculator.

## Advice and Precautions

- This calculator contains precision components such as LSI chips and should not be used in places subject to rapid variations in temperature, excessive humidity, dirt or dust, or exposed to direct sunlight.
- The liquid crystal display panel is made of glass and should not be subjected to excessive pressure.
- When cleaning the device, do not use a damp cloth or volatile liquid such as paint thinner. Instead, use only a soft, dry cloth.
